

Howard says that Artificial Intelligence is a bad thing. Is he right?

Howard's claim of Artificial Intelligence being a bad thing is not necessarily correct in my opinion, as it creates new opportunities in many sectors, from increasing efficiency in warehouses to providing enhanced medical diagnostics. It can also facilitate the automation of vehicles, which can decrease the frequency of road incidents and allow disabled people to travel independently. However this may cause a loss of jobs in sectors where manual labour can be replaced by AI, and jobs will open up in maintaining these AI models, which requires high levels of skill and extensive training. This would cause the displacement of workers and exacerbate income inequality issues across the country.

Furthermore, there are ethical concerns that arise with the use of AI.

Vast amounts of data has to be collected and analysed in order to train and improve the performance of these models, which many people oppose due to the fact that they feel like it is a violation of their privacy. Some worry that AI models may get so advanced to the point that they become self-conscious and overrule the human population.

In my opinion, AI can be a great tool and bring huge advancement in our technical abilities, but without strict guidelines it may cause more harm than good.
